

# Virtual Memory:

## *malloc, method 3: segregated free lists*

# Keeping Track of Free Blocks

- Method 1: *Implicit list* using length—links all blocks

- Method 2: *Explicit list* among the free blocks using pointers

- Method 3: *Segregated free list*
  - Different free lists for different size classes

# Segregated List (Seglist) Allocators

- Each *size class* of blocks has its own free list

- Often have separate classes for each small size
- For larger sizes: One class for each two-power size

# Seglist Allocator

- Given an array of free lists, each one for some size class
- To allocate a block of size  $n$ :
  - Search appropriate free list for block of size  $m > n$
  - If an appropriate block is found:
    - Split block and place fragment on appropriate list (optional)
  - If no block is found, try next larger class
  - Repeat until block is found
- If no block is found:
  - Request additional heap memory from OS (using **sbrk()**)
  - Allocate block of  $n$  bytes from this new memory
  - Place remainder as a single free block in largest size class.

# Seglist Allocator (cont.)

## ■ To free a block:

- Coalesce and place on appropriate list

## ■ Advantages of seglist allocators

- Higher throughput
  - log time for power-of-two size classes
- Better memory utilization
  - First-fit search of segregated free list approximates a best-fit search of entire heap
  - Extreme case: Giving each block its own size class is equivalent to best-fit!
