

# Linker Symbols

## ■ Global symbols

- Symbols defined by module  $m$  that can be referenced by other modules.
- E.g.: non-**static** C functions and non-**static** global variables.

## ■ External symbols

- Global symbols that are referenced by module  $m$  but defined by some other module.

## ■ Local symbols

- Symbols that are defined and referenced exclusively by module  $m$ .
- E.g.: C functions and global variables defined with the **static** attribute.
- **Local linker symbols are *not* local program variables**

# Step 1: Symbol Resolution

```
int sum(int *a, int n);

int array[2] = {1, 2};

int main()
{
    int val = sum(array, 2);
    return val;
}                                     main.c
```

```
int sum(int *a, int n)
{
    int i, s = 0;

    for (i = 0; i < n; i++) {
        s += a[i];
    }
    return s;
}                                     sum.c
```

# Step 1: Symbol Resolution

Referencing  
a global...

```
int sum(int *a, int n);  
  
int array[2] = {1, 2};  
  
int main()  
{  
    int val = sum(array, 2);  
    return val;  
}  
  
main.c
```

```
int sum(int *a, int n)  
{  
    int i, s = 0;  
  
    for (i = 0; i < n; i++) {  
        s += a[i];  
    }  
    return s;  
}  
  
sum.c
```

# Step 1: Symbol Resolution

...that's defined here

Referencing  
a global...

```
int sum(int *a, int n);  
int array[2] = {1, 2};  
  
int main()  
{  
    int val = sum(array, 2);  
    return val;  
}  
  
main.c
```

```
int sum(int *a, int n)  
{  
    int i, s = 0;  
  
    for (i = 0; i < n; i++) {  
        s += a[i];  
    }  
    return s;  
}  
  
sum.c
```

# Step 1: Symbol Resolution

...that's defined here

Referencing  
a global...

```
int sum(int *a, int n);  
int array[2] = {1, 2};  
  
int main()  
{  
    int val = sum(array, 2);  
    return val;  
}  
  
main.c
```

Defining  
a global

```
int sum(int *a, int n)  
{  
    int i, s = 0;  
  
    for (i = 0; i < n; i++) {  
        s += a[i];  
    }  
    return s;  
}  
  
sum.c
```

# Step 1: Symbol Resolution

...that's defined here

Referencing  
a global...

```
int sum(int *a, int n);  
int array[2] = {1, 2};  
  
int main()  
{  
    int val = sum(array, 2);  
    return val;  
}  
  
main.c
```

Defining  
a global

Referencing  
a global...

```
int sum(int *a, int n)  
{  
    int i, s = 0;  
  
    for (i = 0; i < n; i++) {  
        s += a[i];  
    }  
    return s;  
}  
  
sum.c
```

# Step 1: Symbol Resolution

...that's defined here

Referencing  
a global...

```
int sum(int *a, int n);  
int array[2] = {1, 2};  
  
int main()  
{  
    int val = sum(array, 2);  
    return val;  
}  
  
main.c
```

Defining  
a global

Referencing  
a global...

...that's defined here

```
int sum(int *a, int n)  
{  
    int i, s = 0;  
    for (i = 0; i < n; i++) {  
        s += a[i];  
    }  
    return s;  
}  
  
sum.c
```

# Step 1: Symbol Resolution

...that's defined here

Referencing  
a global...

```
int sum(int *a, int n);  
int array[2] = {1, 2};  
  
int main()  
{  
    int val = sum(array, 2);  
    return val;  
}  
  
main.c
```

Defining  
a global

Linker knows  
nothing of val

Referencing  
a global...

...that's defined here

```
int sum(int *a, int n)  
{  
    int i, s = 0;  
    for (i = 0; i < n; i++) {  
        s += a[i];  
    }  
    return s;  
}  
  
sum.c
```

# Step 1: Symbol Resolution

...that's defined here

Referencing  
a global...

```
int sum(int *a, int n);  
int array[2] = {1, 2};  
  
int main()  
{  
    int val = sum(array, 2);  
    return val;  
}  
  
main.c
```

Defining  
a global

Linker knows  
nothing of val

Referencing  
a global...

...that's defined here

```
int sum(int *a, int n)  
{  
    int i, s = 0;  
    for (i = 0; i < n; i++) {  
        s += a[i];  
    }  
    return s;  
}  
  
sum.c
```

Linker knows  
nothing of i or s

# Local Symbols

## ■ Local non-static C variables vs. local static C variables

- local non-static C variables: stored on the stack
- local static C variables: stored in either `.bss`, or `.data`

```
int f()
{
    static int x = 0;
    return x;
}

int g()
{
    static int x = 1;
    return x;
}
```

# Local Symbols

## ■ Local non-static C variables vs. local static C variables

- local non-static C variables: stored on the stack
- local static C variables: stored in either `.bss`, or `.data`

```
int f()
{
    static int x = 0;
    return x;
}

int g()
{
    static int x = 1;
    return x;
}
```

Compiler allocates space in `.data` for each definition of `x`

# Local Symbols

## ■ Local non-static C variables vs. local static C variables

- local non-static C variables: stored on the stack
- local static C variables: stored in either `.bss`, or `.data`

```
int f()
{
    static int x = 0;
    return x;
}

int g()
{
    static int x = 1;
    return x;
}
```

Compiler allocates space in `.data` for each definition of `x`

Creates local symbols in the symbol table with unique names, e.g., `x.1` and `x.2`.

# How Linker Resolves Duplicate Symbol Definitions

- Program symbols are either *strong* or *weak*
  - **Strong**: procedures and initialized globals
  - **Weak**: uninitialized globals

p1.c

```
int foo=5;

p1() {
}
```

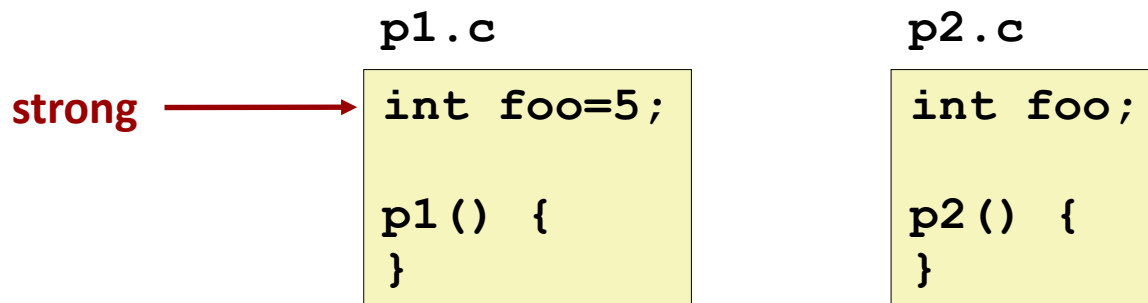

p2.c

```
int foo;

p2() {
}
```

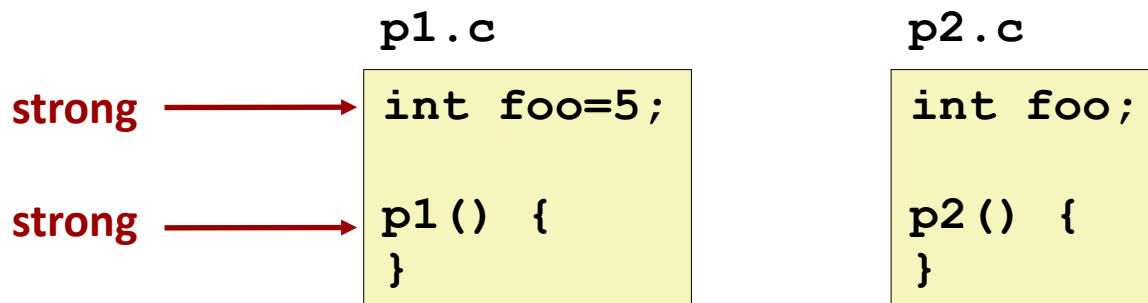

# How Linker Resolves Duplicate Symbol Definitions

- Program symbols are either *strong* or *weak*
  - **Strong**: procedures and initialized globals
  - **Weak**: uninitialized globals

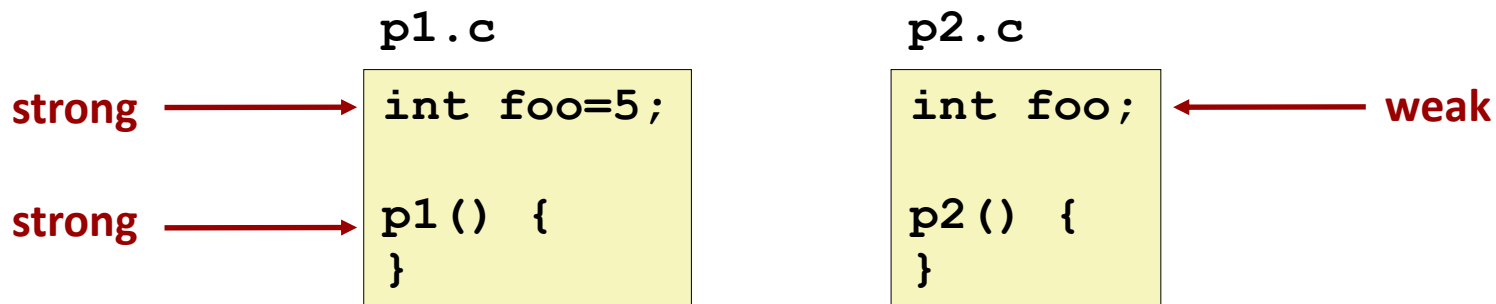

# How Linker Resolves Duplicate Symbol Definitions

# How Linker Resolves Duplicate Symbol Definitions

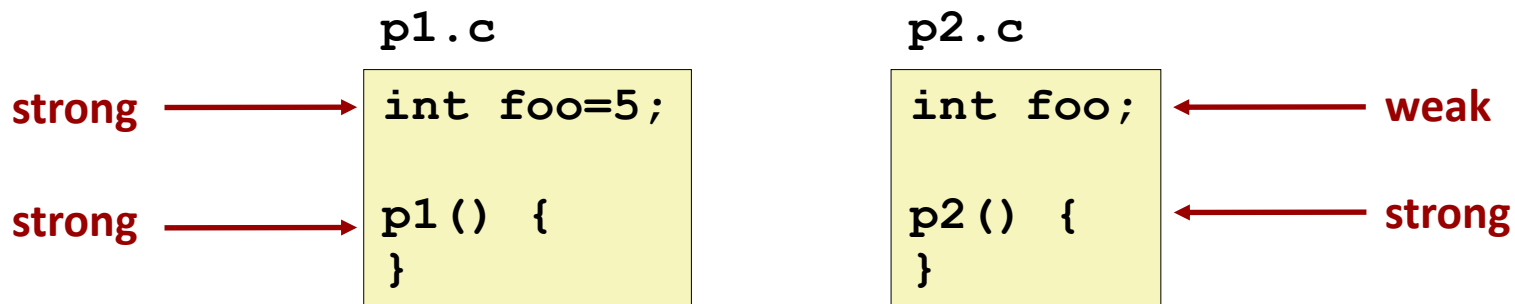

- Program symbols are either *strong* or *weak*
  - **Strong**: procedures and initialized globals
  - **Weak**: uninitialized globals

# Linker's Symbol Rules

- **Rule 1: Multiple strong symbols are not allowed**
  - Each item can be defined only once
  - Otherwise: Linker error

# Linker's Symbol Rules

- **Rule 1: Multiple strong symbols are not allowed**
  - Each item can be defined only once
  - Otherwise: Linker error
  
- **Rule 2: Given a strong symbol and multiple weak symbols, choose the strong symbol**
  - References to the weak symbol resolve to the strong symbol

# Linker's Symbol Rules

- **Rule 1: Multiple strong symbols are not allowed**
  - Each item can be defined only once
  - Otherwise: Linker error
  
- **Rule 2: Given a strong symbol and multiple weak symbols, choose the strong symbol**
  - References to the weak symbol resolve to the strong symbol
  
- **Rule 3: If there are multiple weak symbols, pick an arbitrary one**
  - Can override this with `gcc -fno-common`

# Linker Puzzles

```
int x;  
p1() {}
```

```
p1() {}
```

# Linker Puzzles

```
int x;  
p1() {}
```

```
p1() {}
```

Link time error: two strong symbols (**p1**)

# Linker Puzzles

```
int x;  
p1() {}
```

```
p1() {}
```

Link time error: two strong symbols (**p1**)

```
int x;  
p1() {}
```

```
int x;  
p2() {}
```

int x;  
p1() {}
```

```
p1() {}
```

Link time error: two strong symbols (**p1**)

```
int x;  
p1() {}
```

```
int x;  
p2() {}
```

References to **x** will refer to the same uninitialized int. Is this what you really want?

# Linker Puzzles

```
int x;  
p1() {}
```

```
p1() {}
```

Link time error: two strong symbols (**p1**)

```
int x;  
p1() {}
```

```
int x;  
p2() {}
```

References to **x** will refer to the same uninitialized int. Is this what you really want?

```
int x;  
int y;  
p1() {}
```

```
double x;  
p2() {}
```

# Linker Puzzles

```
int x;  
p1() {}
```

```
p1() {}
```

Link time error: two strong symbols (**p1**)

```
int x;  
p1() {}
```

```
int x;  
p2() {}
```

References to **x** will refer to the same uninitialized int. Is this what you really want?

```
int x;  
int y;  
p1() {}
```

```
double x;  
p2() {}
```

Writes to **x** in **p2** might overwrite **y**!  
Evil!

Nasty!

```
int x=7;
p1() {}
```

```
int x;
p2() {}
```

References to **x** will refer to the same initialized variable.

**Nightmare scenario: two identical weak structs, compiled by different compilers with different alignment rules.**

# Global Variables

- **Avoid if you can**
  
- **Otherwise**
  - Use **static** if you can
  - Initialize if you define a global variable
  - Use **extern** if you reference an external global variable
